

Voice and Data Cabling

We all need telephones and most homes and businesses have 2 or more computers networked together with some form of high speed Internet. As systems grow and as more software products are implemented, the workload of an organisation's infrastructure grows rapidly.

The infrastructure is the medium that connects users with voice and data systems, and applications; without a robust cabling system in place your network can fail, drastically affecting productivity. It follows that your cabling infrastructure is of far greater importance than that of any hardware that will connect to it.

For the greatest flexibility, it has become common practice to combine your voice and data cabling into a single cabling plan, integrating voice, video and data traffic over the same network infrastructure; expert design and implementation of voice and data cabling is one of our specialities. In addition to this we offer network point relocation as well as changes and additions to phone systems.

All voice and data cabling is professionally installed by our trained technicians to the highest standards because your voice and data cabling is only as good as its weakest link. Getting it right depends on the best combination of skilled people, quality products and exceptional performance throughout the life of the system.

We offer installations that include CAT5, CAT6, Fibre Optic, Voice, Wireless, Network Switches, Patch Panels and Cabinets. Our initial site survey and consultation is offered at no charge enabling you to take full advantage of our expertise and experience.
